

Properties:

1.  $A \cdot B = B \cdot A$  ( com. law)
2.  $(\lambda A) \cdot B = A \cdot (\lambda B) = \lambda(A \cdot B)$
3.  $A \cdot (B + C) = A \cdot B + A \cdot C$  (dist. law)

Proof: The first two properties are direct consequences of the definition. To prove the distributive law

$$A \cdot (B + C) = A \cdot B + A \cdot C \quad (0.1)$$

consider  $\vec{BR} = \vec{OC}$  (see fig.), and projections  $B'$ ,  $R'$  of  $B$ ,  $R$  on  $OA$ . Then,

$$\begin{aligned} A \cdot (B+C) &= A \cdot R \\ &= A \cdot R' \text{ (Geom. interp. 1)} \\ &= A \cdot (B' + C') \\ &= A \cdot B' + A \cdot C' \text{ (collinearity of vectors)} \\ &= A \cdot B + A \cdot C \text{ (Geom. interp. 1)} \end{aligned}$$

Now we derive the analytic expression

$$A \cdot B = a_1 b_1 + a_2 b_2 + a_3 b_3 \text{ for } A = (a_1, a_2, a_3), B = (b_1, b_2, b_3). \quad (0.2)$$

Expanding

$$A \cdot B = (a_1 i + a_2 j + a_3 k) \cdot (b_1 i + b_2 j + b_3 k) \quad (0.3)$$

by distributive law, we get nine terms, six of which are zero by properties

$$i \cdot j = 0, j \cdot k = 0, k \cdot i = 0 \quad (0.4)$$

for orthogonal vectors  $i, j, k$  and the remaining terms are

$$a_1 b_1, a_2 b_2, a_3 b_3 \quad (0.5)$$

by the properties  $i \cdot i = 1, j \cdot j = 1, k \cdot k = 1$  for unit vectors  $i, j, k$
